Non base-change classes

Bianchi groups: $\Gamma = SL_2(\mathbb{Z}_F)$ with *F* quadratic imaginary. Finis, Grunewald, Tirao: formula for the base-change subspace in $H^i(\Gamma, E_k)$. Remark: very few non base-change classes.

Non base-change classes

Bianchi groups: $\Gamma = SL_2(\mathbb{Z}_F)$ with *F* quadratic imaginary. Finis, Grunewald, Tirao: formula for the base-change subspace in $H^i(\Gamma, E_k)$. Remark: very few non base-change classes. Şengün, Rahm: extended their computations.

Non base-change classes

Bianchi groups: $\Gamma = SL_2(\mathbb{Z}_F)$ with *F* quadratic imaginary. Finis, Grunewald, Tirao: formula for the base-change subspace in $H^i(\Gamma, E_k)$. Remark: very few non base-change classes. Şengün, Rahm: extended their computations.

Conjecture (Modified Maeda's conjecture)

The set of non-lifted cuspidal newforms in $H^i(\Gamma, E_k)$, modulo twins, forms one Galois orbit.

Non base-change classes

Bianchi groups: $\Gamma = SL_2(\mathbb{Z}_F)$ with *F* quadratic imaginary. Finis, Grunewald, Tirao: formula for the base-change subspace in $H^i(\Gamma, E_k)$. Remark: very few non base-change classes. Şengün, Rahm: extended their computations.

Conjecture (Modified Maeda's conjecture)

The set of non-lifted cuspidal newforms in $H^i(\Gamma, E_k)$, modulo twins, forms one Galois orbit.

Experiment : always dimension 2 space, except (d, k) = (-199, 2): dimension 4.

Non base-change classes

Bianchi groups: $\Gamma = SL_2(\mathbb{Z}_F)$ with *F* quadratic imaginary. Finis, Grunewald, Tirao: formula for the base-change subspace in $H^i(\Gamma, E_k)$. Remark: very few non base-change classes. Şengün, Rahm: extended their computations.

Conjecture (Modified Maeda's conjecture)

The set of non-lifted cuspidal newforms in $H^i(\Gamma, E_k)$, modulo twins, forms one Galois orbit.

Experiment : always dimension 2 space, except (d, k) = (-199, 2): dimension 4. Two twin Galois orbits with coefficients in $\mathbb{Q}(\sqrt{13})$, swapped by $\operatorname{Gal}(F/\mathbb{Q})$.

э

Everywhere good reduction abelian surfaces

Bianchi group for $F = \mathbb{Q}(\sqrt{-223})$. Have a look at the fundamental domain! Cuspidal subspace in $H^1(\Gamma, \mathbb{C})$: dimension 2, one Galois orbit in $\mathbb{Q}(\sqrt{5})$.

Everywhere good reduction abelian surfaces

Bianchi group for $F = \mathbb{Q}(\sqrt{-223})$. Have a look at the fundamental domain! Cuspidal subspace in $H^1(\Gamma, \mathbb{C})$: dimension 2, one Galois orbit in $\mathbb{Q}(\sqrt{5})$.

Şengün, Dembélé : the Jacobian J of the hyperelliptic curve

$$\begin{array}{rl} y^2 &= 33x^6 + 110\sqrt{-223}x^5 + 36187x^4 - 28402\sqrt{-223}x^3 \\ &- 2788739x^2 + 652936\sqrt{-223}x + 14157596 \end{array}$$

has good reduction everywhere, $End(J) \otimes \mathbb{Q} \cong \mathbb{Q}(\sqrt{5})$ and matches the Hecke eigenvalues.
