# Algorithms on abelian varieties for cryptography 

Damien Robert ${ }^{1}$<br>${ }^{1}$ Microsoft Research<br>17/01/2012 (LIX)

## Outline

(1) Public-key cryptography
2. Abelian varieties
(3) Theta functions
(4) Isogenies
(5) Examples

## Discrete logarithm

## Definition (DLP)

Let $G=\langle g\rangle$ be a cyclic group of prime order. Let $x \in \mathbb{N}$ and $h=g^{x}$. The discrete logarithm $\log _{g}(h)$ is $x$.

- Exponentiation: $O(\log p)$. DLP: $\widetilde{O}(\sqrt{p})$ (in a generic group). So we can use the DLP for public key cryptography.
$\Rightarrow$ We want to find secure groups with efficient addition law and compact representation.

## Pairing-based cryptography

## Definition

A pairing is a bilinear application $e: G_{1} \times G_{1} \rightarrow G_{2}$.

## Example

- If the pairing $e$ can be computed easily, the difficulty of the DLP in $G_{1}$ reduces to the difficulty of the DLP in $G_{2}$.
$\Rightarrow$ MOV attacks on supersingular elliptic curves.
- Identity-based cryptography [BF03].
- Short signature [BLSO4].
- One way tripartite Diffie-Hellman [Jou04].
- Self-blindable credential certificates [Ver01].
- Attribute based cryptography [SW05].
- Broadcast encryption [GPS+06].

## Example of applications

## Tripartite Diffie-Helman

Alice sends $g^{a}$, Bob sends $g^{b}$, Charlie sends $g^{c}$. The common key is

$$
e(g, g)^{a b c}=e\left(g^{b}, g^{c}\right)^{a}=e\left(g^{c}, g^{a}\right)^{b}=e\left(g^{a}, g^{b}\right)^{c} \in G_{2}
$$

Example (Identity-based cryptography)

- Master key: $(P, s P)$, s. $\quad s \in \mathbb{N}, P \in G_{1}$.
- Derived key: $Q, s Q . \quad Q \in G_{1}$.
- Encryption, $m \in G_{2}: m^{\prime}=m \oplus e(Q, s P)^{r}, r P . \quad r \in \mathbb{N}$.
- Decryption: $m=m^{\prime} \oplus e(s Q, r P)$.

## Elliptic curves

## Definition (car $k \neq 2,3$ )

An elliptic curve is a plan curve of equation

$$
y^{2}=x^{3}+a x+b \quad 4 a^{3}+27 b^{2} \neq 0
$$

## Abelian varieties

## Definition

An Abelian variety is a complete connected group variety over a base field $k$.

- Abelian variety = points on a projective space (locus of homogeneous polynomials) + an abelian group law given by rational functions.
- Abelian variety of dimension $1=$ elliptic curves.
$\Rightarrow$ Abelian varieties are just the generalization of elliptic curves in higher dimension.

## Pairings on abelian varieties

The Weil and Tate pairings on abelian varieties are the only known examples of cryptographic pairings.

$$
e_{W}: A[\ell] \times A[\ell] \rightarrow \mu_{\ell} \subset \mathbb{F}_{q^{k}}^{*}
$$

## Abelian surfaces

Abelian varieties of dimension 2 are given by: 5 quadratic equations in $\mathbb{P}^{7}$.

$$
\begin{array}{r}
\left(4 a_{1} a_{2}+4 a_{5} a_{6}\right) X_{1} X_{6}+\left(4 a_{1} a_{2}+4 a_{5} a_{6}\right) X_{2} X_{5}= \\
\left(4 a_{3} a_{4} 4 a_{4} a_{3}\right) X_{3} X_{4}+\left(4 a_{3} a_{4} 4 a_{4} a_{3}\right) X_{7} X_{8} ; \\
\left(2 a_{1} a_{5}+2 a_{2} a_{6}\right) X_{1}^{2}+\left(2 a_{1} a_{5}+2 a_{2} a_{6}\right) X_{2}^{2}+\left(-2 a_{3}^{2}-2 a_{4}^{2}-2 a_{3}^{2}-2 a_{4}^{2}\right) X_{3} X_{3}= \\
\left(2 a_{3}^{2}+2 a_{4}^{2}+2 a_{3}^{2}+2 a_{4}^{2}\right) X_{4} X_{8}+\left(-2 a_{1} a_{5}-2 a_{2} a_{6}\right) X_{5}^{2}+\left(-2 a_{1} a_{5}-2 a_{2} a_{6}\right) X_{6}^{2} ; \\
\left(4 a_{1} a_{6}+4 a_{2} a_{5}\right) X_{1} X_{2}+\left(-4 a_{3} a_{4}-4 a_{3} a_{4}\right) X_{3} X_{8}= \\
\left(4 a_{3} a_{4}+4 a_{3} a_{4}\right) X_{4} X_{7}+\left(-4 a_{1} a_{6}-4 a_{2} a_{5}\right) X_{5} X_{6} ; \\
\left(2 a_{1}^{2}+2 a_{2}^{2}+2 a_{5}^{2}+2 a_{6}^{2}\right) X_{1} X_{5}+\left(2 a_{1}^{2}+2 a_{2}^{2}+2 a_{5}^{2}+2 a_{6}^{2}\right) X_{2} X_{6}+\left(-2 a_{3} a_{3}-2 a_{4} a_{4}\right) X_{3}^{2}= \\
\left(2 a_{3} a_{3}+2 a_{4} a_{4}\right) X_{4}^{2}+\left(2 a_{3} a_{3}+2 a_{4} a_{4}\right) X_{7}^{2}+\left(2 a_{3} a_{3}+2 a_{4} a_{4}\right) X_{8}^{2} ; \\
\left(2 a_{1}^{2}-2 a_{2}^{2}+2 a_{5}^{2}-2 a_{6}^{2}\right) X_{1} X_{5}+\left(-2 a_{1}^{2}+2 a_{2}^{2}-2 a_{5}^{2}+2 a_{6}^{2}\right) X_{2} X_{6}+\left(-2 a_{3} a_{3}+2 a_{4} a_{4}\right) X_{3}^{2}= \\
\left(-2 a_{3} a_{3}+2 a_{4} a_{4}\right) X_{4}^{2}+\left(2 a_{3} a_{3}-2 a_{4} a_{4}\right) X_{7}^{2}+\left(-2 a_{3} a_{3}+2 a_{4} a_{4}\right) X_{8}^{2} ;
\end{array}
$$

where the parameters satisfy 2 quartic equations in $\mathbb{P}^{5}$ :
$a_{1}^{3} a_{5}+a_{1}^{2} a_{2} a_{6}+a_{1} a_{2}^{2} a_{5}+a_{1} a_{5}^{3}+a_{1} a_{5} a_{6}^{2}+a_{2}^{3} a_{6}+a_{2} a_{5}^{2} a_{6}+a_{2} a_{6}^{3}-2 a_{3}^{4}-4 a_{3}^{2} a_{4}^{2}-2 a_{4}^{4}=0$;

$$
a_{1}^{2} a_{2} a_{6}+a_{1} a_{2}^{2} a_{5}+a_{1} a_{5} a_{6}^{2}+a_{2} a_{5}^{2} a_{6}-4 a_{3}^{2} a_{4}^{2}=0
$$

The most general form actually use 72 quadratic equations in 16 variables.

## Jacobian of hyperelliptic curves

$C: y^{2}=f(x)$, hyperelliptic curve of genus $g . \quad(\operatorname{deg} f=2 g+1)$

- Divisor: formal sum $D=\sum n_{i} P_{i}, \quad P_{i} \in C(\bar{k})$.

$$
\operatorname{deg} \bar{D}=\sum n_{i} .
$$

- Principal divisor: $\sum_{P \in C(\bar{k})} v_{P}(f) . P ; \quad f \in \bar{k}(C)$.

Jacobian of $C=$ Divisors of degree 0 modulo principal divisors + Galois action

$$
=\text { Abelian variety of dimension } g \text {. }
$$

- Divisor class $D \Rightarrow$ unique representative (Riemann-Roch):

$$
D=\sum_{i=1}^{k}\left(P_{i}-P_{\infty}\right) \quad k \leqslant g, \quad \text { symmetric } P_{i} \neq P_{j}
$$

- Mumford coordinates: $D=(u, v) \Rightarrow u=\prod\left(x-x_{i}\right), v\left(x_{i}\right)=y_{i}$.
- Cantor algorithm: addition law.

## Abelian varieties as Jacobians

Dimension 2: Jacobians of hyperelliptic curves of genus 2:

$$
y^{2}=f(x), \operatorname{deg} f=5 .
$$

$$
\begin{aligned}
& D=P_{1}+P_{2}-2 \infty \\
& D^{\prime}=Q_{1}+Q_{2}-2 \infty
\end{aligned}
$$

## Abelian varieties as Jacobians

Dimension 2: Jacobians of hyperelliptic curves of genus 2:

$$
y^{2}=f(x), \operatorname{deg} f=5 .
$$

$$
\begin{aligned}
& D=P_{1}+P_{2}-2 \infty \\
& D^{\prime}=Q_{1}+Q_{2}-2 \infty
\end{aligned}
$$

## Abelian varieties as Jacobians

Dimension 2: Jacobians of hyperelliptic curves of genus 2:

$$
y^{2}=f(x), \operatorname{deg} f=5 .
$$

## Abelian varieties as Jacobians

## Dimension 3

Jacobians of hyperelliptic curves of genus 3.

Jacobians of quartics.

## Abelian varieties as Jacobians

Dimension 4
Abelian varieties do not come from a curve generically.

## Security of abelian varieties

| $g$ | \# points | DLP |
| :---: | :--- | :--- |
| 1 | $O(q)$ | $\widetilde{O}\left(q^{1 / 2}\right)$ |
| 2 | $O\left(q^{2}\right)$ | $\widetilde{O}(q)$ |
| 3 | $O\left(q^{3}\right)$ | $\widetilde{O}\left(q^{4 / 3}\right)$ (Jacobian of an hyperelliptic curve) |
| $g$ |  | $\widetilde{O}(q) \quad$ (Jacobian of a quartic) <br> $g>\log (q)$ |
| $O\left(q^{g}\right)$ | $L_{1 / 2}\left(q^{g}\right)=\exp \left(O(1) \log (x)^{1 / 2} \log \log (x)^{1 / 2}\right)$ |  |
|  |  | Security of the DLP |

- Weak curves (MOV attack, Weil descent, anomal curves).

## Complex abelian varieties

- Abelian variety over $\mathbb{C}: A=\mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\Omega \mathbb{Z}^{g}\right)$, where $\Omega \in \mathscr{H}_{g}(\mathbb{C})$ the Siegel upper half space.
- The theta functions with characteristic are analytic (quasi periodic) functions on $\mathbb{C}^{g}$.

$$
\vartheta\left[\begin{array}{l}
a \\
b
\end{array}\right](z, \Omega)=\sum_{n \in \mathbb{Z}^{g}} e^{\pi i^{t}(n+a) \Omega(n+a)+2 \pi i^{t}(n+a)(z+b)} \quad a, b \in \mathbb{Q}^{g}
$$

Quasi-periodicity:
$\vartheta\left[\begin{array}{l}a \\ b\end{array}\right]\left(z+m_{1} \Omega+m_{2}, \Omega\right)=e^{2 \pi i\left(t \cdot m_{2}-t\right.}{ }_{\left.b \cdot m_{1}\right)-\pi i t^{t} m_{1} \Omega m_{1}-2 \pi i t^{t} m_{1} \cdot z} \vartheta\left[\begin{array}{c}a \\ b\end{array}\right](z, \Omega)$.

- Projective coordinates:

$$
\begin{array}{rll}
A & \longrightarrow & \mathbb{P}_{\mathbb{C}}^{n^{-1}} \\
z & \longmapsto\left(\vartheta_{i}(z)\right)_{i \in Z(\bar{n})}
\end{array}
$$

where $Z(\bar{n})=\mathbb{Z}^{g} / n \mathbb{Z}^{g}$ and $\vartheta_{i}=\vartheta\left[\begin{array}{l}0 \\ \frac{i}{n}\end{array}\right]\left(., \frac{\Omega}{n}\right)$.

## Theta functions of level $n$

- Translation by a point of $n$-torsion:

$$
\vartheta_{i}\left(z+\frac{m_{1}}{n} \Omega+\frac{m_{2}}{n}\right)=e^{-\frac{2 \pi i}{n} t_{i \cdot m_{1}}} \vartheta_{i+m_{2}}(z) .
$$

- $\left(\vartheta_{i}\right)_{i \in Z(\bar{n})}$ : basis of the theta functions of level $n$ $\Leftrightarrow A[n]=A_{1}[n] \oplus A_{2}[n]:$ symplectic decomposition.
- $\left(\vartheta_{i}\right)_{i \in Z(\bar{n})}= \begin{cases}\text { coordinates system } & n \geqslant 3 \\ \text { coordinates on the Kummer variety } A / \pm 1 & n=2\end{cases}$
- Theta null point: $\vartheta_{i}(0)_{i \in Z(\bar{n})}=$ modular invariant.

## The differential addition law $(k=\mathbb{C})$

$$
\begin{aligned}
&\left(\sum_{t \in Z(\overline{2})} \chi(t) \vartheta_{i+t}(x+y) \vartheta_{j+t}(x-y)\right) \cdot\left(\sum_{t \in Z(\overline{2})} \chi(t) \vartheta_{k+t}(0) \vartheta_{l+t}(0)\right)= \\
&\left(\sum_{t \in Z(\overline{2})} \chi(t) \vartheta_{-i^{\prime}+t}(y) \vartheta_{j^{\prime}+t}(y)\right) \cdot\left(\sum_{t \in Z(\overline{2})} \chi(t) \vartheta_{k^{\prime}+t}(x) \vartheta_{l^{\prime}+t}(x)\right) .
\end{aligned}
$$

where $\quad \chi \in \hat{Z}(\overline{2}), i, j, k, l \in Z(\bar{n})$

$$
\begin{aligned}
& \left(i^{\prime}, j^{\prime}, k^{\prime}, l^{\prime}\right)=A(i, j, k, l) \\
& A=\frac{1}{2}\left(\begin{array}{cccc}
1 & 1 & 1 & 1 \\
1 & 1 & -1 & -1 \\
1 & -1 & 1 & -1 \\
1 & -1 & -1 & 1
\end{array}\right)
\end{aligned}
$$

## Example: addition in genus 1 and in level 2

Differential Addition Algorithm:
Input: $P=\left(x_{1}: z_{1}\right), Q=\left(x_{2}: z_{2}\right)$
and $R=P-Q=\left(x_{3}: z_{3}\right)$ with $x_{3} z_{3} \neq 0$.
Output: $P+Q=\left(x^{\prime}: z^{\prime}\right)$.
(1) $x_{0}=\left(x_{1}^{2}+z_{1}^{2}\right)\left(x_{2}^{2}+z_{2}^{2}\right)$;
(2) $z_{0}=\frac{A^{2}}{B^{2}}\left(x_{1}^{2}-z_{1}^{2}\right)\left(x_{2}^{2}-z_{2}^{2}\right)$;
(3) $x^{\prime}=\left(x_{0}+z_{0}\right) / x_{3}$;
(9) $z^{\prime}=\left(x_{0}-z_{0}\right) / z_{3}$;
(5) Return $\left(x^{\prime}: z^{\prime}\right)$.

## Cost of the arithmetic with low level theta functions

 ( $\operatorname{car} k \neq 2$ )|  | Mumford | Level 2 | Level 4 |
| :--- | :---: | :---: | :---: |
| Doubling <br> Mixed Addition | $34 M+7 S$ |  |  |

Multiplication cost in genus 2 (one step).

|  | Montgomery | Level 2 | Jacobians coordinates |
| :--- | :---: | :---: | :---: |
| Doubling <br> Mixed Addition | $5 M+4 S+1 m_{0}$ | $3 M+6 S+3 m_{0}$ | $3 M+5 S$ |
|  |  | $7 M+6 S+1 m_{0}$ |  |

Multiplication cost in genus 1 (one step).

## The Weil pairing on elliptic curves

- Let $E: y^{2}=x^{3}+a x+b$ be an elliptic curve over $k$ ( $\operatorname{car} k \neq 2,3$ ).
- Let $P, Q \in E[\ell]$ be points of $\ell$-torsion.
- Let $f_{P}$ be a function associated to the principal divisor $\ell(P-0)$, and $f_{Q}$ to $\ell(Q-0)$. We define:

$$
e_{W, \ell}(P, Q)=\frac{f_{Q}(P-0)}{f_{P}(Q-0)}
$$

- The application $e_{W, \ell}: E[\ell] \times E[\ell] \rightarrow \mu_{\ell}(\bar{k})$ is a non degenerate pairing: the Weil pairing.

## The Weil and Tate pairing with theta coordinates

$P$ and $Q$ points of $\ell$-torsion.

| $0_{A}$ | $P$ | $2 P$ | $\cdots$ | $\ell P=\lambda_{P}^{0} 0_{A}$ |
| :---: | :---: | :---: | :---: | :---: |
| $Q$ | $P \oplus Q$ | $2 P+Q$ | $\ldots$ | $\ell P+Q=\lambda_{P}^{1} Q$ |
| $2 Q$ | $P+2 Q$ |  |  |  |
| $\cdots$ | $\ldots$ |  |  |  |
| $\ell Q=\lambda_{Q}^{0} 0_{A}$ | $P+\ell Q=\lambda_{Q}^{1} P$ |  |  |  |

- $e_{W, \ell}(P, Q)=\frac{\lambda_{p}^{1} \lambda_{Q}^{0}}{\lambda_{p}^{\circ} \lambda_{Q}^{1}}$.

If $P=\Omega x_{1}+x_{2}$ and $Q=\Omega y_{1}+y_{2}$, then $e_{W, \ell}(P, Q)=e^{-2 \pi i \ell\left(t x_{1} \cdot y_{2}-t y_{1} \cdot x_{2}\right)}$.

- $e_{T, \ell}(P, Q)=\frac{\lambda_{p}^{1}}{\lambda_{p}}$.

## Why does it works?

$$
\begin{array}{ccccc}
0_{A} & \alpha P & \alpha^{4}(2 P) & \ldots & \alpha^{\ell}(\ell P)=\lambda_{P}^{\prime 0} 0_{A} \\
\beta Q & \gamma(P \oplus Q) & \frac{\gamma^{2} \alpha^{2}}{\beta}(2 P+Q) & \ldots & \frac{\gamma^{\ell} \alpha^{\ell(l-1)}}{\beta^{\ell-1}}(\ell P+Q)=\lambda^{\prime 1} \beta \zeta \\
\beta^{4}(2 Q) & \frac{\gamma^{2} \beta^{2}}{\alpha}(P+2 Q) & & & \\
\ldots & \ldots & & & \\
\beta^{\ell^{2}}(\ell Q)=\lambda_{Q}^{0} 0_{A} & \frac{\gamma^{\ell} \beta^{\ell \ell-1)}}{\alpha^{\ell-1}}(P+\ell Q)=\lambda_{Q}^{1} \alpha P & &
\end{array}
$$

We then have

$$
\begin{gathered}
\lambda_{P}^{\prime 0}=\alpha^{\ell^{2}} \lambda_{P}^{0}, \quad \lambda_{Q}^{\prime 0}=\beta^{\ell} \lambda_{Q}^{0}, \quad \lambda_{P}^{\prime 1}=\frac{\gamma^{\ell} \alpha^{\ell(\ell-1)}}{\beta^{\ell}} \lambda_{P}^{1}, \quad \lambda_{Q}^{\prime 1}=\frac{\gamma^{\ell} \beta^{(\ell(\ell-1)}}{\alpha^{\ell}} \lambda_{Q}^{1} \\
e_{W, \ell}^{\prime}(P, Q)=\frac{\lambda_{P}^{\prime 1} \lambda_{Q}^{\prime 0}}{\lambda_{P}^{\prime 0} \lambda_{Q}^{1}}=\frac{\lambda_{P}^{1} \lambda_{Q}^{0}}{\lambda_{P}^{0} \lambda_{Q}^{1}}=e_{W, \ell}(P, Q), \\
e_{T, \ell}^{\prime}(P, Q)=\frac{\lambda_{P}^{\prime 1}}{\lambda_{P}^{\prime 0}}=\frac{\gamma^{\ell}}{\alpha^{\ell} \beta^{\ell}} \frac{\lambda_{P}^{1}}{\lambda_{P}^{0}}=\frac{\gamma^{\ell}}{\alpha^{\ell} \beta^{\ell}} e_{T, \ell}(P, Q) .
\end{gathered}
$$

## Isogenies

## Definition

A (separable) isogeny is a finite surjective (separable) morphism between two Abelian varieties.

- Isogenies = Rational map + group morphism + finite kernel.
- Isogenies $\Leftrightarrow$ Finite subgroups.

$$
\begin{aligned}
& (f: A \rightarrow B) \mapsto \operatorname{Ker} f \\
& (A \rightarrow A / H) \hookleftarrow H
\end{aligned}
$$

- Example: Multiplication by $\ell(\Rightarrow \ell$-torsion), Frobenius (non separable).

## Cryptographic usage of isogenies

- Transfer the DLP from one Abelian variety to another.
- Point counting algorithms ( $\ell$-adic or $p$-adic) $\Rightarrow$ Verify a curve is secure.
- Compute the class field polynomials (CM-method) $\Rightarrow$ Construct a secure curve.
- Compute the modular polynomials $\Rightarrow$ Compute isogenies.
- Determine $\operatorname{End}(A) \Rightarrow$ CRT method for class field polynomials.

## Vélu's formula

## Theorem

Let $E: y^{2}=f(x)$ be an elliptic curve and $G \subset E(k)$ a finite subgroup. Then $E / G$ is given by $Y^{2}=g(X)$ where

$$
\begin{aligned}
& X(P)=x(P)+\sum_{Q \in G \backslash\left\{0_{E}\right\}}(x(P+Q)-x(Q)) \\
& Y(P)=y(P)+\sum_{Q \in G \backslash\left\{0_{E}\right\}}(y(P+Q)-y(Q)) .
\end{aligned}
$$

- Uses the fact that $x$ and $y$ are characterised in $k(E)$ by

$$
\begin{array}{rrr}
v_{0_{E}}(x)=-2 & v_{P}(x) \geqslant 0 & \text { if } P \neq 0_{E} \\
v_{0_{E}}(y)=-3 & v_{P}(y) \geqslant 0 & \text { if } P \neq 0_{E} \\
y^{2} / x^{3}\left(0_{E}\right)=1 & &
\end{array}
$$

- No such characterisation in genus $g \geqslant 2$ for Mumford coordinates.

## The isogeny theorem

## Theorem

- Let $\varphi: Z(\bar{n}) \rightarrow Z(\overline{\ell n}), x \mapsto \ell . x$ be the canonical embedding. Let $K=A_{2}[\ell] \subset A_{2}[\ell n]$.
- Let $\left(\vartheta_{i}^{A}\right)_{i \in Z \overline{(\overline{l n})}}$ be the theta functions of level $\ell n$ on $A=\mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\Omega \mathbb{Z}^{g}\right)$.
- Let $\left(\vartheta_{i}^{B}\right)_{i \in Z(\bar{n})}$ be the theta functions of level $n$ of $B=A / K=\mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\frac{\Omega}{\ell} \mathbb{Z}^{g}\right)$.
- We have:

$$
\left(\vartheta_{i}^{B}(x)\right)_{i \in Z(\bar{n})}=\left(\vartheta_{\varphi(i)}^{A}(x)\right)_{i \in Z(\bar{n})}
$$

## Example

$\pi:\left(x_{0}, x_{1}, x_{2}, x_{3}, x_{4}, x_{5}, x_{6}, x_{7}, x_{8}, x_{9}, x_{10}, x_{11}\right) \mapsto\left(x_{0}, x_{3}, x_{6}, x_{9}\right)$ is a 3-isogeny between elliptic curves.

## An example with $g=1, n=2, \ell=3$

$$
z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n \xrightarrow{[\ell]} \ell z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n
$$

## An example with $g=1, n=2, \ell=3$

$$
z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n \xrightarrow{[\ell]} \ell z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n
$$

## An example with $g=1, n=2, \ell=3$

$$
z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n \xrightarrow{[\ell]} \ell z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n
$$

## An example with $g=1, n=2, \ell=3$

$$
z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n \xrightarrow{[\ell]} \ell z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n
$$

## An example with $g=1, n=2, \ell=3$

$$
z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n \xrightarrow{[\ell]} \ell z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n
$$

## An example with $g=1, n=2, \ell=3$

$$
z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n \xrightarrow{[\ell]} \ell z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n
$$

## An example with $g=1, n=2, \ell=3$

$$
z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n \xrightarrow{[\ell]} \ell z \in \mathbb{C}^{g} /\left(\mathbb{Z}^{g}+\ell \Omega \mathbb{Z}^{g}\right) \text {, level } \ell n
$$

## Changing level

## Theorem (Koizumi-Kempf)

Let $F$ be a matrix of rank $r$ such that ${ }^{t} F F=\ell \operatorname{Id}_{r}$. Let $X \in\left(\mathbb{C}^{g}\right)^{r}$ and $Y=F(X) \in\left(\mathbb{C}^{g}\right)^{r}$. Let $j \in\left(\mathbb{Q}^{g}\right)^{r}$ and $i=F(j)$. Then we have

$$
\begin{aligned}
& \vartheta\left[\begin{array}{c}
0 \\
i_{1}
\end{array}\right]\left(Y_{1}, \frac{\Omega}{n}\right) \ldots \vartheta\left[\begin{array}{c}
0 \\
i_{r}
\end{array}\right]\left(Y_{r}, \frac{\Omega}{n}\right)= \\
& \sum_{\substack{t_{1}, \ldots, t_{r} \in \frac{1}{\ell} \mathbb{Z}^{g} / \mathbb{Z}^{g} \\
F\left(t_{1}, \ldots, t_{r}\right)=(0, \ldots, 0)}} \vartheta\left[\begin{array}{c}
0 \\
j_{1}
\end{array}\right]\left(X_{1}+t_{1}, \frac{\Omega}{\ell n}\right) \ldots \vartheta\left[\begin{array}{c}
0 \\
j_{r}
\end{array}\right]\left(X_{r}+t_{r}, \frac{\Omega}{\ell n}\right),
\end{aligned}
$$

(This is the isogeny theorem applied to $F_{A}: A^{r} \rightarrow A^{r}$.)

- If $\ell=a^{2}+b^{2}$, we take $F=\left(\begin{array}{cc}a & b \\ -b & a\end{array}\right)$, so $r=2$.
- In general, $\ell=a^{2}+b^{2}+c^{2}+d^{2}$, we take $F$ to be the matrix of multiplication by $a+b i+c j+d k$ in the quaternions, so $r=4$.
$\Rightarrow$ We have a complete algorithm to compute the isogeny $A \mapsto A / K$ given the kernel $K$ [Cosset, Lubicz, R.].

## AVIsogenies

- AVIsogenies: Magma code written by Bisson, Cosset and R. http://avisogenies.gforge.inria.fr
- Released under LGPL 2+.
- Implement isogeny computation (and applications thereof) for abelian varieties using theta functions.
- Current release 0.2: isogenies in genus 2.

## Implementation

$H$ hyperelliptic curve of genus 2 over $k=\mathbb{F}_{q}, J=\operatorname{Jac}(H), \ell$ odd prime, $2 \ell \wedge \operatorname{car} k=1$. Compute all rational $(\ell, \ell)$-isogenies $J \mapsto \mathrm{Jac}\left(H^{\prime}\right)$ (we suppose the zeta function known):

- Compute the extension $\mathbb{F}_{q^{n}}$ where the geometric points of the maximal isotropic kernel of $J[\ell]$ lives.
(3) Compute a "symplectic" basis of $J[\ell]\left(\mathbb{F}_{q^{n}}\right)$.
( - Find the rational maximal isotropic kernels $K$.
- For each kernel $K$, convert its basis from Mumford to theta coordinates of level 2. (Rosenhain then Thomae).
© Compute the other points in $K$ in theta coordinates using differential additions.
(0) Apply the change level formula to recover the theta null point of $J / K$.
- Compute the Igusa invariants of $J / K$ ("Inverse Thomae").
( Distinguish between the isogeneous curve and its twist.

## Implementation

## Computing the right extension

- $J=\operatorname{Jac}(H)$ abelian variety of dimension 2. $\chi(X)$ the corresponding zeta function.
- Degree of a point of $\ell$-torsion | the order of $X$ in $\mathbb{F}_{\ell}[X] / \chi(X)$.
- If $K$ rational, $K(\bar{k}) \simeq(\mathbb{Z} / \ell \mathbb{Z})^{2}$, the degree of a point in $K \mid$ the LCM of orders of $X$ in $\mathbb{F}_{\ell}[X] / P(X)$ for $P \mid \chi$ of degree two.
- Since we are looking to $K$ maximal isotropic, $J[\ell] \simeq K \oplus K^{\prime}$ and we know that $P \mid \chi$ is such that $\chi(X) \equiv P(X) P(\bar{X}) \bmod \ell$ where $\bar{X}=q / X$ represents the Verschiebung.

## Remark

The degree $n$ is $\leqslant \ell^{2}-1$. If $\ell$ is totally split in $\mathbb{Z}[\pi, \bar{\pi}]$ then $n \mid \ell-1$.

## Computing the $\ell$-torsion

- We want to compute $J\left(\mathbb{F}_{q^{n}}\right)[\ell]$.
- From the zeta function $\chi(X)$ we can compute random points in $J\left(\mathbb{F}_{q^{n}}\right)\left[\ell^{\infty}\right]$ uniformly.
- If $P$ is in $J\left(\mathbb{F}_{q^{n}}\right)\left[\ell^{\infty}\right], \ell^{m} P \in J\left(\mathbb{F}_{q^{n}}\right)[\ell]$ for a suitable $m$. This does not give uniform points of $\ell$-torsion but we can correct the points obtained.

## Example

- Suppose $J\left(\mathbb{F}_{q^{n}}\right)\left[\ell^{\infty}\right]=<P_{1}, P_{2}>$ with $P_{1}$ of order $\ell^{2}$ and $P_{2}$ of order $\ell$.
- First random point $Q_{1}=P_{1} \Rightarrow$ we recover the point of $\ell$-torsion: $\ell . P_{1}$.
- Second random point $Q_{2}=\alpha P_{1}+\beta P_{2}$. If $\alpha \neq 0$ we recover the point of $\ell$-torsion $\alpha \ell P_{1}$ which is not a new generator.
- We correct the original point: $Q_{2}^{\prime}=Q_{2}-\alpha Q_{1}=\beta P_{2}$.

## Isogeny graphs for elliptic curves

## 000

## Horizontal isogeny graphs: $\ell=q_{1} q_{2}=Q_{1} \bar{Q}_{1} Q_{2} \overline{Q_{2}}$

## Horizontal isogeny graphs: $\ell=q_{1} q_{2}=Q_{1} \bar{Q}_{1} Q_{2} \overline{Q_{2}}$

## Horizontal isogeny graphs: $\ell=q=Q \bar{Q}$ $\left(\mathbb{Q} \mapsto K_{0} \mapsto K\right)$

## Horizontal isogeny graphs: $\ell=q_{1} q_{2}=Q_{1} \bar{Q}_{1} Q_{2}^{2}$

## Horizontal isogeny graphs: $\ell=q^{2}=Q^{2} \bar{Q}^{2}$

## Horizontal isogeny graphs: $\ell=q^{2}=Q^{4}$

## General isogeny graphs $(\ell=q=Q \bar{Q})$

## General isogeny graphs ( $\ell=q=Q \bar{Q}$ )

## General isogeny graphs ( $\left.\ell=q_{1} q_{2}=Q_{1} \bar{Q}_{1} Q_{2} \overline{Q_{2}}\right)$

## General isogeny graphs $\left(\ell=q_{1} q_{2}=Q_{1} \bar{Q}_{1} Q_{2} \overline{Q_{2}}\right)$

## General isogeny graphs $\left(\ell=q_{1} q_{2}=Q_{1} \bar{Q}_{1} Q_{2} \overline{Q_{2}}\right)$
